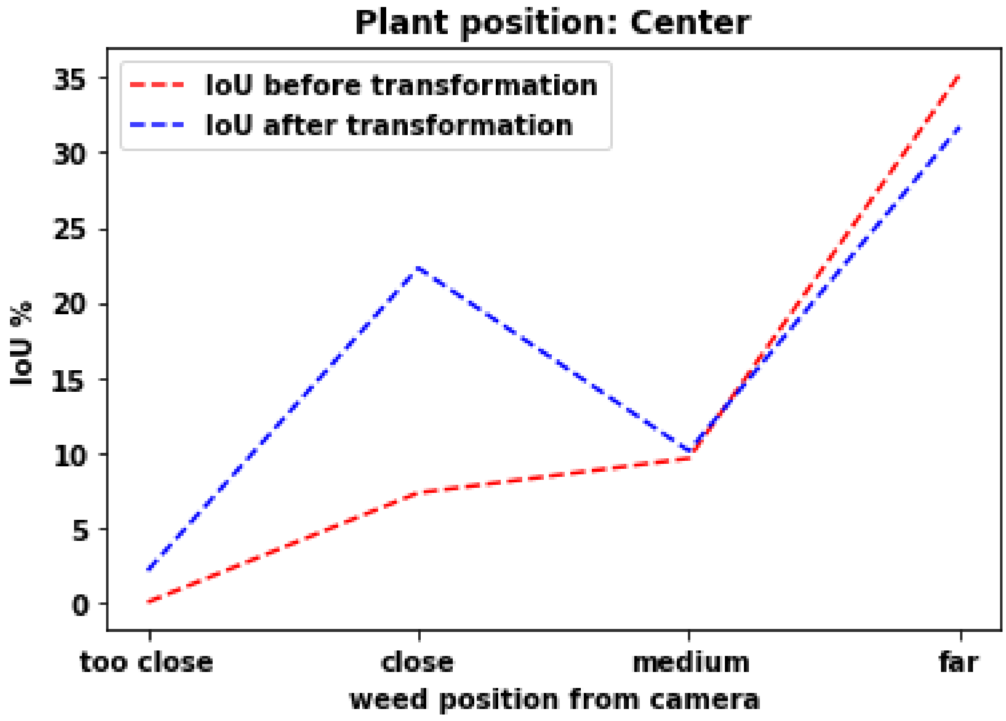
white_bb = Polygon([(450,100), (450,400), (850,400), (850,100)])

white_bb_transform = Polygon([[683, -73], [418, 228],[821, 370], [1103,60]])
```



Possible sources of inaccuracy:

1. **Bounding boxes are different in size. As a result can't compare directly between two scenarios (total area in IoU calc. is different).**
2. **Detector detects wrongly and BB at a wrong place not covering the weed.**
3. **The further we move from camera, overlap region between two camera increases. The closer we are the further the BB are after projection. Because we are doing 2d plane projection, the further we are from camera the effect of projection difference decreases. If we go to infinity the BB will overlap.**
4. **When we are (rorate+translate) the left cam, we are doing it on a 2d projection. As a result this fails to capture the 3d position of the weed.**

To overcome some of this, Next section, try with same size BB for all scenarios. Also select BB which are most correct at covering weed area.

BB size:

X = 450 pixels

Y = 300 pixels

Result 05 (Center far)
